

Load test executed for 500 users.

The application is running as a docker image on a local machine (6-core Intel Core i7 2,6GHz, 16GB 2,4 GHz, Intel UHD Graphics 630 1,5Gb), OS Sequoia 15.7.4.

Non-functional defects from performance perspective are not detected.

the goal of testing is to check latency of the app under load (500 users).

The report contains results:

- 1) Response times:
 - all requests have response time < 500ms
- 2) In 89% of requests response time is less then 250ms
- 3) Requests out of regularity:
 - /characters request at 11 active threads has responsive time > 200 ms, which is potential bottleneck if number of user will raise;
- 4) Number of responses per ms also reflects possible bottleneck with /characters request (see **Response Time Distribution** chart)
